

Regent Lighting Solutions

Regent Lighting Solutions is part of Wahl Industries, a South African based manufacturing company which currently employs 240 dedicated staff members who all contribute to our success and the understanding of the unique African environment in which we work.

PIAZZA: EXPLODED VIEW OF HEAD

Sustainable Investment

We have invested in a Solar system as an alternative energy source at our premises. The 300 kWp roof top grid-tied photovoltaic solar system which consists of a 1,200 250W Polycrystalline panel, will generate approximately 541,328 kWh per annum reducing our carbon emissions.

Our in-house Goniometer, which allows us to independently photometer our luminaires to ensure the correct lamp or LED diode positioning and thus ensuring maximum efficiency. This is a critical

element in the design process of our fittings as it allows us to ensure lighting performance while retaining the design integrity.

In-House Design

Regent takes a complete systems approach to identifying intelligent lighting solutions for designers and consultants who are seeking cost effective high quality products that are manufactured in Africa.

We have an in-house design team consisting of four industrial designers who work closely with the sales team and architects, engineers and lighting designers throughout the concept development and design stages; interpreting sketches, brainstorming, drawing up concepts and creating 3D renderings of the product, to ensure design specifications are achieved. The team also consists of a Lighting Designer who uses CAD software to meet the most demanding customers needs and provide lighting design solutions for exterior and interior projects.

Developing light fittings to compliment the architectural design of buildings, Regent's product range is continually evolving to meet the technical and design demands of our market. Embracing new technology, we work closely with leading component manufacturers to develop luminaires that accommodate the latest

TRACK LIGHTING

technology in energy efficiency and controls. Designing and developing our own products in-house allows us the flexibility to develop customised lighting solutions.

LED Development

Regent prides itself on being at the forefront of technology and incorporating the use of LED's by adapting our existing products and designing new products. Regent will continue to work closely with the top LED suppliers to develop products that meet the exacting standards and innovation that we are known for.

We are expanding rapidly into the interior lighting market and have developed an extensive range of LED Linear lighting products and are currently developing lighting systems for internal retail applications.
